1. Social Leads

1.1 Overview

The Social Leads module allows you to import leads from social media platforms (Facebook, Instagram, etc.) into the CRM via Excel file upload. This is ideal for importing leads collected from social media ad campaigns, lead generation forms, and marketing initiatives.

Key Feature: Bulk import with intelligent column auto-detection. The system automatically recognizes common column names from various social media export formats.

1.2 Accessing Social Leads

To access the Social Leads module:

1. Log in to the ScanWell CRM system.
2. In the left sidebar, under the "Info" section, click "Social Leads".
3. The Social Leads page will display with a table of all imported leads.

1.3 Preparing Your Excel File

Before importing, ensure your Excel file (.xlsx or .xls) contains the lead data with recognizable column headers. The system supports flexible column naming:

Field	Accepted Column Names	Required	Data Type
Full Name	Full Name, Name, Lead Name, Customer Name, Contact Name, User Name	Yes	Text
Email	Email, Email Address, E-mail, Mail, Contact Email	No	Text (email)
Phone Number	Phone Number, Phone, TP, Mobile, Contact Number, Mobile Number, Telephone	No	Text
Ad Name	Ad Name, Advertisement, Ad, Campaign Name, Campaign	No	Text
Form Name	Form Name, Form, Lead Form, Source Form	No	Text
Created Time	Created Time, Created Date, Date, Submission Date, Timestamp, Submitted At	No	Date / DateTime

Tip: You can export leads directly from Facebook Ads Manager or LinkedIn Campaign Manager. The system will automatically recognize most standard export column names.

1.4 Importing Leads (Step-by-Step)

Step 1: Upload Excel File

1. Click the "Upload Excel" button on the Social Leads page.
2. A modal window will appear with a drag-and-drop zone.
3. Either drag your Excel file onto the zone, or click to browse and select the file.
4. Only .xlsx and .xls files are accepted.

Step 2: Map Columns

After uploading, the system will attempt to automatically detect and map your Excel columns to CRM fields.

If auto-detection succeeds: The system will skip directly to the preview step.

If auto-detection is incomplete: A column mapping interface will appear:

1. On the left side, you will see your Excel column headers with sample data.
2. On the right side, you will see the 6 target CRM fields.
3. Click an Excel column to select it (highlighted in orange).
4. Then click the corresponding target field to create a mapping.
5. Mapped columns will be highlighted in green.
6. A progress indicator shows how many fields are mapped (e.g., "4 of 6 fields mapped").
7. Click "Confirm Mapping" when ready.

Note: At minimum, the "Full Name" field must be mapped for the import to proceed. Other fields are optional but recommended.

Step 3: Preview & Import

4. A preview table shows the first 10 rows of your mapped data.
5. Review the data to ensure columns are correctly mapped.
6. If corrections are needed, click "Edit Mapping" to go back.
7. The total number of leads ready for import is displayed (e.g., "50 lead(s) ready to import").
8. Click "Import X Lead(s)" to begin the import.

9. A success message will confirm the number of leads imported.
10. Click "Done" to close the modal. The leads table will refresh automatically.

1.5 Managing Imported Leads

Searching Leads

Use the search bar at the top of the leads table to filter by name, email, phone number, ad name, or form name. Search results update in real-time as you type.

Editing a Lead

5. Click the edit (pencil) icon on any lead row.
6. An edit modal will appear with all lead fields pre-populated.
7. Modify the desired fields.
8. Click "Save Changes" to update the lead.

Deleting Leads

Single Delete: Click the delete (trash) icon on a lead row and confirm the deletion.

Bulk Delete: Select multiple leads using the checkboxes, then click the bulk delete button. A confirmation dialog will show the count of selected leads.

Sorting

Click any column header to sort leads in ascending or descending order. An arrow indicator shows the current sort direction.

Pagination

The table displays 20 leads per page. Use the Previous/Next buttons or page numbers at the bottom to navigate through pages.

2. Web Leads

2.1 Overview

The Web Leads module captures and manages leads from your company website and other web-based sources. Leads can be submitted through an integrated web form or added via the CRM API, and are managed through the Web Leads dashboard.

2.2 Accessing Web Leads

To access the Web Leads module:

11. Log in to the ScanWell CRM system.
12. In the left sidebar, under the "Info" section, click "Web Leads".
13. The Web Leads page will display all captured web leads.

2.3 Website Integration Setup

To capture leads from your company website, you need to set up a web form that submits data to the CRM API.

API Endpoint

Property	Value
Method	POST
URL	https://crmback.scanwellapps.com/api/WebLead/web-lead
Content-Type	application/json
Authentication	JWT Token (via cookie)

Request Body Format

The web form should submit data in the following JSON format:

```
{
  "name": "Customer Full Name",
  "tp": "+94 77 123 4567",
  "email": "customer@example.com"
}
```

Web Lead Data Fields

Field	JSON Key	Required	Description
Name	name	Yes	Full name of the lead / customer
Phone	tp	No	Contact telephone number
Email	email	No	Email address of the lead

2.4 Sample Website Contact Form

Below is a sample HTML form that can be embedded on your website to capture web leads and submit them to the CRM:

```
<form id="contactForm">
  <input type="text" name="name"
    placeholder="Your Name" required />
  <input type="tel" name="tp"
    placeholder="Phone Number" />
  <input type="email" name="email"
    placeholder="Email Address" />
  <button type="submit">Submit</button>
</form>

<script>
document.getElementById("contactForm")
  .addEventListener("submit", async (e) => {
    e.preventDefault();
    const form = e.target;
    await fetch(
      "https://crmback.scanwellapps.com
        /api/WebLead/web-lead",
      {
        method: "POST",
        headers: {"Content-Type":
          "application/json"},
        body: JSON.stringify({
          name: form.name.value,
          tp: form.tp.value,
          email: form.email.value
        })
      })
  });
  alert("Thank you!");
});
</script>
```

Important: For production use, the Web Lead API endpoint must be configured to allow anonymous access if you want external website visitors to submit leads without CRM login credentials. Contact your system administrator to enable this.

2.5 Managing Web Leads

Viewing Web Leads

All captured web leads are displayed in a sortable, searchable table showing:

- Name - Full name of the lead
- Phone - Contact telephone number
- Email - Email address

Searching

Use the search bar to filter web leads by name, email, or phone number. Results update in real-time.

Editing a Web Lead (Admin Only)

9. Click the edit (pencil) icon on the lead row.
10. Modify the name, phone, or email fields in the edit modal.
11. Click "Update" to save changes.

Note: Only administrators can edit or delete web leads. Standard users have view-only access.

Deleting a Web Lead (Admin Only)

14. Click the delete (trash) icon on the lead row.
15. Confirm the deletion in the confirmation dialog.
16. The lead will be permanently removed from the system.

Refreshing Data

Click the refresh button (floating action button at the bottom-right corner) to reload the latest web leads from the server.

3. API Reference

3.1 Social Leads API

Method	Endpoint	Description
GET	/api/Lead	Fetch all social leads
GET	/api/Lead/{id}	Fetch a single lead by ID
POST	/api/Lead/bulk-create	Bulk import leads from Excel data
PUT	/api/Lead/{id}	Update a lead
DELETE	/api/Lead/{id}	Delete a single lead
POST	/api/Lead/bulk-delete	Bulk delete selected leads

3.2 Web Leads API

Method	Endpoint	Description
GET	/api/WebLead/web-leads	Fetch 20 most recent web leads
GET	/api/WebLead/web-leads/all	Fetch all web leads
GET	/api/WebLead/web-lead/{id}	Fetch a single web lead by ID
POST	/api/WebLead/web-lead	Create a new web lead
PUT	/api/WebLead/web-lead	Update an existing web lead
DELETE	/api/WebLead/web-lead/{id}	Delete a web lead

Authentication: All API endpoints require a valid JWT authentication token. The token is automatically managed via browser cookies when using the CRM web application.

4. Troubleshooting

Issue	Solution
Excel upload fails	Ensure the file is .xlsx or .xls format. Check that the file is not open in another program.
Columns not auto-detected	Use standard column names (see Section 1.3). You can also manually map columns in Step 2.
Dates display incorrectly	The system supports Excel serial dates and ISO date strings. Ensure dates are formatted as Date type in Excel.
Web leads not appearing	Click the refresh button. Check that the web form is submitting to the correct API endpoint.
401 Unauthorized error	Your session has expired. Log out and log back in to refresh your authentication token.
Cannot edit/delete web leads	Only administrators can modify web leads. Contact your system administrator for access.
Import shows 0 leads	Verify the Excel file contains data rows below the header row. Empty sheets will result in 0 imports.
Web form submission fails	Check CORS settings, verify the API URL is correct, and ensure the server is running.
